INTRODUCTION

The Hawaiian Volcano Observatory (HVO) summary presents seismic data gathered during the year and a chronological narrative describing the volcanic events. The seismic summary is offered without interpretation as a source of preliminary data. It is complete in the sense that all data for events of $M \geq 1.5$ routinely gathered by the Observatory are included. The emphasis in collection of tilt and deformation data has shifted from quarterly measurements at a few water-tube tilt stations ("wet" tilt) to a larger number of continuously recording borehole tiltmeters, repeated measurements at numerous spirit-level tilt stations ("dry" tilt), and surveying of level and trilateration networks. Because of the large quantity of deformation data now gathered and differing schedules of data reduction, the seismic and deformation summaries are published separately.

The HVO summaries have been published in various forms since 1956. Summaries prior to 1974 were issued quarterly, but cost, convenience of preparation and distribution, and the large quantities of data dictated an annual publication beginning with Summary 74 for the year 1974. Summary 86 (the introduction of CUSP at HVO) includes a description of the seismic instrumentation, calibration, and processing used in recent years. The present summary includes enough background information on the seismic network and processing to allow use of the data and to provide an understanding of how they were gathered.

A report tabulating instrumentation, calibration, and recording history of each seismic station in the network by Klein and Koyanagi is available as a USGS Open-File Report¹. It is designed as a reference for users of seismograms and phase data and includes and augments the information in the station table in this summary.

CHRONOLOGICAL SUMMARY 2000

by

C. Heliker and D. Sherrod

Until last spring, no houses had been overrun since late 1991. But in the last nine months, three long-abandoned structures in lower Royal Gardens were destroyed by the rising tide of pahoehoe on the coastal plain. Flows covered 6 km² in 2000 (fig. C-1), but only 2 km² of that was virgin, vegetated land, the rest being previously covered by lava during this eruption. The total area covered by lava since 1983 is 104 km² (40 mi²), and the volume of lava has topped 2 km³ (0.5 mi³). For the latest statistics, refer to table C-1.

The magma supply to the Pu'u 'O'o flank vent(s) that feed the tube system paused briefly twice in 2000 (table C-2). The frequency of pauses has dropped considerably since the beginning of episode 55, but their complexity has increased. In part, this is due to a surge in the amount of data each pause generates, now that borehole tiltmeters have been installed from the summit down the east rift zone to Pu'u 'O'o cone. But even without considering the new tilt data, it is obvious that the role of the summit in the pauses has become much more variable, both in terms of tilt and seismicity. As episode 55 progresses, it is increasingly difficult to characterize a "typical" pause.

In addition to two pauses, 2000 brought one upper east rift zone intrusion (February 23) and one magmatic surge from the summit to Pu'u 'O'o (September 24). Neither of these events was followed by a bona fide pause, unlike the previous intrusion and surge in episode 55 (September 1999 and January 1998, respectively). There is some evidence that the February 2000 intrusion caused the eruption to pause or slow down for less than 4 hrs, but it is impossible to know for sure since the event was so brief. In contrast, the intrusion of September 1999 depressurized the dike feeding the eruption, causing part of the Pu'u 'O'o crater floor to collapse and the eruption to pause.

The Dog Day surge in September was the first such event of this magnitude since the January 14 surge in 1998. Unlike the earlier event, however, the Dog Day surge was not followed by a pause.

The ocean entries spanned more of the coastline in 2000 than in many years past, extending 5 km from Lae'apuki to the east edge of the episode 55 flow field. At the beginning of the year, the only ocean entry was at Lae'apuki, but in February the broad front of the "Smoke" flow reached the coast and, over the next five months, coated the entire sea cliff from Kamokuna to the east edge of the flow field—bad news if you were a seabird (and there were many) nesting along that particular stretch of coastline.

The main ocean entry was at Waha'ula beginning in April, but smaller entries persisted to the east. When lava reached the ocean again, following pause 30 in late August, Kamokuna became the sole entry. About 7.5 hectares (18.5 acres) of new land were added to the island in 2000. The largest bench collapse of the year, on November 16, was witnessed by a pilot who saw ~1 ha of bench slide into the sea within a few seconds.

The crater of Pu'u 'O'o changed very little this year (fig. C-2). Since the brief period of lava pond activity in September-October 1999, only a few small pads of pahoehoe have extruded on the crater floor. There was some subsidence of the drained pond bed or "trough" near vents, and the "July pit," which formed in late July, has since formed a spatter cone. At the end of the year, the crater floor inside the "trough" (the empty pond left over from late 1999) near the July pit was about 67 m below our camera site on the north rim (or ~51 m below the low point on the east rim, which is our traditional datum for crater depths). The terrace that encircles the trough was about 50 m (34 m) below the camera site, as compared with about 55 m (39 m) at the end of last year. These measurements were made by a reflectorless laser range-finder.

Outside the crater, the west gap pit wins the "most changed" prize for 2000. The spatter cone on the southwest side of the cone collapsed in July, leaving an inner crater about 20 m deep that emitted sloshing sounds when first formed. This collapse pit, which was soon quiet and floored with talus, continued to expand for the next few weeks, slightly enlarging the main pit. During the Dog Day surge, active lava covered the bottom of the west gap pit for 8 hrs before it drained, leaving the pit 35–40 m deep.

Puka Nui, the very large collapse pit on the southwest flank of Pu'u 'O'o, showed little change in size this year. A small inner collapse pit, first observed in July, claimed one of the spatter cones that formed inside Puka Nui during 1999. Mass wasting continued to eat away at ridge separating Puka Nui from the crater.

Lua Hou, a small pit on the shield just south of Puka Nui, was first observed in February. Flowing lava was observed at the bottom of it following the February intrusion. The pit was floored by ponded lava, or at least was very close to active, through September. The next time it was observed from the air, in January 2001, it was dark.

Table C-1. Eruption Statistics

Areas

Total area covered by lava, 3/83 - 12/31/00: **103.7 km²** (40 mi²)

| Episode | Area originally covered | Area exposed, 12/31/00 |
|--|-------------------------|------------------------|
| 1-47 and 48A (mostly Pu'u 'O'o) | 42.0 km ² | 18.5 km ² |
| 48 (Kupaianaha) | 41.0 | 36.7 |
| 49 (between Pu'u 'O'o and Kupaianaha) | 3.9 | 3.9 |
| 50-53 (Pu'u 'O'o flank vents) | 26.4 | 12.1 |
| 54 (in and NE of Napau Crater) | 0.24 | 0.24 |
| 55 (Pu'u 'O'o flank vents) | 32.3 | 32.3 |
| New (vegetated) territory covered in 2000: | 2.2 km ² | |

Net total of new land created, Nov 86 - Dec 2000: 207 hectares (**510 acres**)#

Net new land created during 2000: ~7.5 hectares (**18.5 acres**)

#These figures do not include new land that was claimed by wave erosion or collapse of the active lava bench. Due to these processes, mapping in 1998 and 1999 revealed a decrease in total acreage.

Volumes

Total, 1/83 through 12/00: Approximately **2.018 km³** (dense rock equivalent)

| | | |
|---------------|------------------|---|
| Episodes 1-47 | (1/83 - 6/86) | 385 x 10⁶ m³ |
| Episode 48 | (7/86 - 2/92) | 500 x 10⁶ m³ |
| Episode 49 | (11/91) | 11 x 10⁶ m³ |
| Episode 50 | (2/92 - 3/92) | 4.5 x 10⁶ m³ |
| Episode 51 | (3/92 - 2/93) | 32 x 10⁶ m³ |
| Episode 52 | (10/92) | 2 x 10⁶ m³ |
| Episode 53 | (2/93 - 1/97) | 535 x 10⁶ m³ |
| Episode 54 | (1/97) | 0.3 x 10⁶ m³ |
| Episode 55 | (2/97 - ongoing) | 548 x 10⁶ m³ |

Other fascinating facts

Height of Pu'u 'O'o cone: **~187 m** (613 ft). Cone has lost **68 m** due to collapse since 1986

Dimensions of Pu'u 'O'o crater: **~250 m x 400 m**

Depth of Pu'u 'O'o crater floor, Dec 2000: **~51 m** below the low point on east rim

Dimensions of Episode 50-55 lava shield: **1.8 x 0.8 km**

Height of Episode 50-55 lava shield: **~80 m**

Height of Kupaianaha lava shield: **56 m**

Kupaianaha vent inactive since Feb 1992

Thickness of lava at the coast:

~15-25 m (50-80 ft) over Kalapana Gardens

~25 m (80 ft) over Chain of Craters Rd at Kamoamoa

Highway covered by lava flows from this eruption: **13 km** (8 mi)

Structures destroyed

Structures destroyed in 2000: **3** (Royal Gardens) These are the first buildings overrun since October 1991.

Total structures destroyed since 1983: **187**

Table C-2. Episode 55 pauses, surges, and intrusions

| Ep 55 pause# | | start date & time | End date & time | Length, hrs | Comments |
|---------------|---------|-------------------|------------------|-------------|--|

SEISMIC INSTRUMENTATION

The network. The Hawaiian Volcano Observatory maintains an extensive telemetered seismic network on the Island of Hawai'i. The standard HVO field sensors, 1-Hz geophones, are deployed as single-component, vertical-only units or as three-component combinations of one vertical and two orthogonal horizontal units. The 2000 network consisted of 50 station sites: 10 three-component, 2 six-component (which included a three-component Kinematic Force-Balance accelerometer), one four-component (which included a low-gain vertical with a unity gain setting), one four-component and two two-component (each site included a moderate-gain vertical with a 48db setting), and 34 vertical-component-only sites. The coverage is most dense on and around Kilauea Volcano. During 1999 HVO added to the network three vertical-component-only sites on the Island of Maui. All seismic signals from the network are telemetered in real time to the Observatory for recording.

The Pacific Tsunami Warning Center (NOAA) operates and maintains a network of stations on the islands of Hawai'i, Maui, and O'ahu. In 1999, radio links were established to share data, in real-time, between PTWC and HVO. PTWC signals from one O'ahu three-component station, and one Maui and four Hawai'i vertical-component-only stations, were telemetered to the Observatory for recording.

Figure 1 is a map of selected geographic and geologic features. Figure 2 shows the seismic stations sites operated by HVO and PTWC on the Island of Hawai'i during 2000. Figure 3 indicates the telemetry scheme for the seismic stations on Hawai'i Island, and figures 4a and 4b are expanded views of the telemetry schemes at Kilauea summit: 4a, HVO seismic stations and 4b, broadband network installed by Menlo Park and maintained by HVO. Figure 5 indicates the telemetry scheme for the seismic stations on Maui Island.

Table 1 lists seismic stations by names, four-letter station codes, coordinates in degrees and minutes, elevation in meters, and other data, as described below, pertaining to each station. The list includes all the stations operated by HVO during 2000. Seismic stations operated by PTWC on the Islands of Hawai'i, O'ahu and Maui are also listed. Phase times from PTWC stations, not telemetered to HVO, are used to supplement local earthquakes and earthquakes that occur within the Hawaiian Archipelago but distant from the Hawai'i Island network.

Instrumentation and recording. Each telemetered station's data channel has a voltage-controlled oscillator (VCO) for FM multiplex transmission to HVO via radio. These telemetering stations are all of Type 1, Earthquake Hazards Team (EHT) standard system used in USGS seismic networks (see table 2 for details). After discrimination at the receiver, the analog signals are converted to digital form as part of the routine computer location processing and archiving. Continuous signals from the telemetered network are saved on 4-mm digital-audio tape (DAT) recording units. Three DAT recorders run in automatic rotation, as each ~20-hr tape is filled. Optic recordings are coded in table 1 as follows: H - Helicorder paper, and I - ink paper. DAT and paper records are archived at HVO.

Seismograph response and calibration. Displacement response curve for the short-period seismograph type in use is given in figure 6. The Type 1 curve gives the displacement magnification of the standard EHT system from ground motion at the seismometer to the seismic trace, as seen on a 20x Developocorder film viewer. The curve plots the unit response, which is multiplied by a constant but known factor, CAL, to get the response for an individual station. Individual CAL factors for Type 1 seismographs are Developocorder equivalent peak-to-peak amplitudes, measured in millimeters, of a 100-microvolt 5 to 8-Hz signal introduced to the preamp/VCO in place of the geophone at the field station. The calibration process is normally performed each time a station is visited for other required maintenance.

Table 2. Seismic instrument types

The codes in parentheses refer to the seismometer types listed in Table 1.

Type 1 (Codes E, L, R, and 4, 5) consists of:

- a) Geophone - Electrotech EV-17 (E), Mark Products L4C (L) or Kinematic Ranger SS1 (R). (L) and (R) are 1.0-sec. period moving-magnet vertical- or horizontal- (E-W and N-S) component seismometers adjusted for an output of 0.5 volts/cm/sec and 0.8, critically damped.
- b) Preamp/VCO - USGS/OEVE Model J402 (4), J502 (5) voltage-controlled oscillator. Three db points for bandpass filter at 0.1 Hz and 30 Hz. Signals are transmitted on audio FM carrier over cable or FM radio link to HVO.

Code (W) - Wood-Anderson torsion seismograph.

Code (MW) - Horizontal-component seismograph based on a Type 1 system and modified to 3x a Wood-Anderson response.

Code (F) - Kinematic Force-Balance Accelerometer (FBA23).

Code (S13) - Geotech, 1Hz seismometer with A1 VCO operated by the Pacific Tsunami Warning Center.

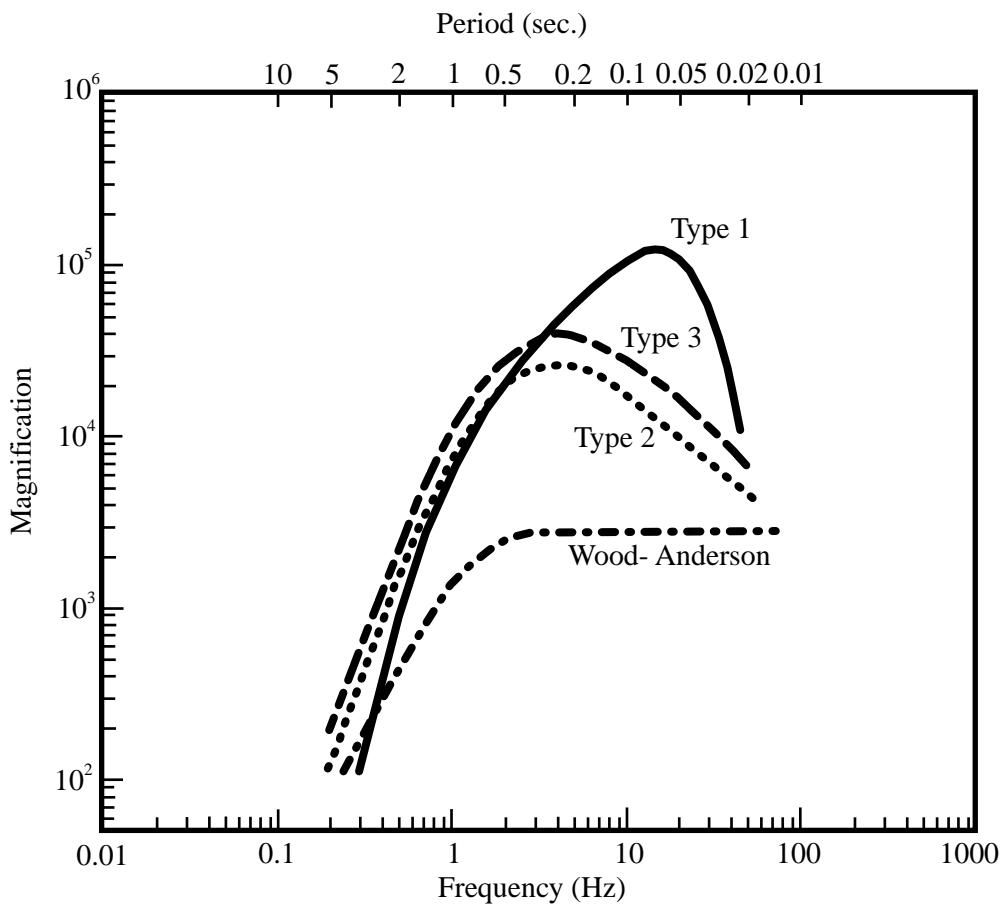

Figure 6. System-response curves for the Wood-Anderson torsion seismograph and for seismometers used by the Hawaiian Volcano Observatory. Type 1 is the standard OEVE seismometer system recorded on Developorder film and DAT tape. The curve for Type 1 includes response of the geophone, all electronics including telemetry, Developorder galvanometer, and projection of film by a 20x viewer. The curve plots the unit response, which should be multiplied by a constant but known factor (CAL) to get the response for an individual station.

SEISMIC DATA PROCESSING

Due to age and high cost of maintenance, Develocorder 'A' was discontinued on August 1, 1997. Daily count of classified microearthquakes from source regions around Kilauea and Mauna Loa, and duration of tremor, were also discontinued. Coda duration, however, is measured in seconds from drum (ink or helicorder) records to determine a coda magnitude that is entered as an external magnitude in the final solution.

In 1986, HVO acquired a VAX 11-750 computer and adopted the CUSP (California Institute of Technology USGS Seismic Processing) routine. Discriminated analog signals are converted to digital form, and detected events are saved in real time. Detected events are demultiplexed, and P-picks are made by the computer, producing a rough location. Events are examined by an analyst, on a graphics terminal, to refine computer P-picks and to time additional P- and S-phases for a preliminary location. Binary CUSP files are tape-archived and translated into ASCII phase files. Locations and amplitude magnitudes are then determined, using the program HYPOINVERSE (Klein, 2000)². Events are reworked and rerun, as needed, to produce a final solution. Magneto-optical copies of arrival times and output summary data are kept at HVO.

In July 1992, HVO acquired VAX workstations for timing earthquakes using a "generic" version of CUSP. In addition to timing P and S arrival signals, the VAX workstations are capable of measuring peak-to-peak amplitudes along with the associated period. This capability allowed the renewal of amplitude magnitude determinations from the network seismic stations. Amplitude data gathered from July 1992 to July 1997 became part of a test set to determine magnitude corrections for network stations. Results of newly determined magnitude corrections are detailed by Nakata and Okubo (1997)³.

The crustal model used is specified by velocities at four depth points. Velocity at any depth is given by linear interpolation between points and uses a homogeneous half-space, as listed below:

| VELOCITY (km/sec) | DEPTH (km) |
|----------------------|---------------|
| 1.9 | 0.0 |
| 6.5 | 4.6 |
| 6.9 | 15.0 |
| 8.3 | ≥16.5 |

Two empirical sets of station delays or corrections were used in the HYPOINVERSE locations and are given in table 1. The delay models are separated by a circle of radius 34 km, centered at 19°22' N and 155°10' W. Delay model 1 is used for epicenters occurring within a circle of radius 31 km from the center. This region includes Kilauea and its south flank. A combination of the two delay models is used for epicenters that fall in a transition zone that is 6 km wide. Delay model 2 is applied to the rest of the island and offshore earthquakes. For a detailed description, refer to Klein (in press)².

Magnitudes for events are computed using recorded amplitudes on selected network vertical, Modified Wood-Anderson (MW) horizontal, and/or moderate and low gain stations. Amplitude readings are corrected to an equivalent Wood-Anderson amplitude using the curves of figure 6 and CAL factors listed in table 1.

Duration magnitude is determined by the length of signal, in seconds, read from drum recordings of Type 1 seismographs. This length of time is measured from the P arrival to the point where the earthquake signal has decayed to nearly the background noise level. Drum-recorded duration magnitude is calculated with a relationship equivalent to the develocorder viewer output.

² Klein, F.W., in press, User's guide to HYPOINVERSE-2000, a Fortran Program to solve for earthquake locations and magnitudes: U.S. Geological Survey, 116 p.

³ Nakata, J., and Okubo, P., 1997, Determination of station amplitude magnitude corrections for the Hawaiian Volcano Observatory telemetered seismograph network: Data from 1992-1997: U.S. Geological Survey Open-File Report 97-863, 73 p.

SEISMIC CATALOG

The emphasis in both station coverage and detailed data analysis is on the highly active south half of the Island of Hawai'i. The set of well-recorded earthquakes located in the Hawai'i Island region is nearly complete above magnitude 2.0. Many smaller events are located in the densely instrumented Kilauea area. Substantial effort is made to locate earthquakes elsewhere within the Hawaiian Archipelago. Such coverage cannot be as complete as in south Hawai'i, but nearly all events above magnitude 4.0 are located with limited precision.

Data presented in the seismic catalog are in three parts: (1) Maps showing computer-located hypocenters are given in figures 11-24. The location maps are of different scales and provide hypocenters with magnitude thresholds set at 1.0, 2.0, 3.0, and 3.5, varying according to region. (2) The list of computer locations constitutes the bulk of this summary and is given in table 4. Each earthquake in the list is assigned a three-letter code based on its general location and depth. Figures 7-10 are maps of the regions used to assign the location codes. The latitude and longitude limits of rectangular regions are listed in table 3. When the listed coordinates overlap, precedence is given according to figures 7-10. (3) Table 5 re-lists the events in table 4 for which the preferred magnitude is 3.0 or larger. This list includes many of the earthquakes felt in Hawai'i.

Table 3. Names and coordinates of regions used for classifying earthquakes.

All earthquakes locate in one of the following groups, identified by a numerical class or three-letter code:

—Shallow:

- 1 SNC - Shallow north caldera (0-5 km)
- 2 SSC - Shallow south caldera (0-5 km)
- 3 SEC - Shallow east caldera (0-5 km)
- 4 SER - Shallow east rift (0-5 km)
- 5 SME - Shallow middle east rift (0-5 km)
- 6 KOA - Koa'e fault zone (0-5 km)
- 7 SSF - Shallow south flank (0-5 km)
- 8 SLE - Shallow lower east rift (0-5 km)

—Intermediate depth:

- 9 SF1 - Kilauea south flank (5-13 km) (west end)
- 10 SF2 - Kilauea south flank (5-13 km)
- 11 SF3 - Kilauea south flank (5-13 km)
- 12 SF4 - Kilauea south flank (5-13 km)
- 13 SF5 - Kilauea south flank (5-13 km) (east end)
- 14 LER - Lower east rift (5-99 km)
- 15 MLO - Mauna Loa (0-13 km)
- 16 LSW - Lower southwest rift zones of Kilauea and Mauna Loa (0-13 km)
- 17 GLN - Glenwood (0-13 km)
- 18 SWR - Southwest rift zone of Kilauea (0-13 km)
- 19 INT - Intermediate caldera (5-13 km)
- 20 KAO - Ka'ohiki (0-13 km)

—Deep:

- 21 DEP - Deep Kilauea (>13 km) (below regions 1-13, 17-19)
- 22 DLS - Deep lower southwest rift zone of Kilauea and Mauna Loa (>13 km) (below region 16)
- 23 DML - Deep Mauna Loa (>13 km) (below regions 15, 20)

—Outer regions, all depths:

- 24 LOI - Loihi
- 25 KON - South Kona
- 26 HUA - Hualalai
- 27 KOH - Kohala
- 28 KEA - Mauna Kea
- 29 HIL - Hilo
- 30 DIS - Distant, everywhere else

Table 3 (continued). The latitude and longitude limits of the regions are given below. If the coordinates overlap, precedence is given according to maps in figures 7-10.

intermediate (5.1–13.0 km depth), $M \geq 2.0$.

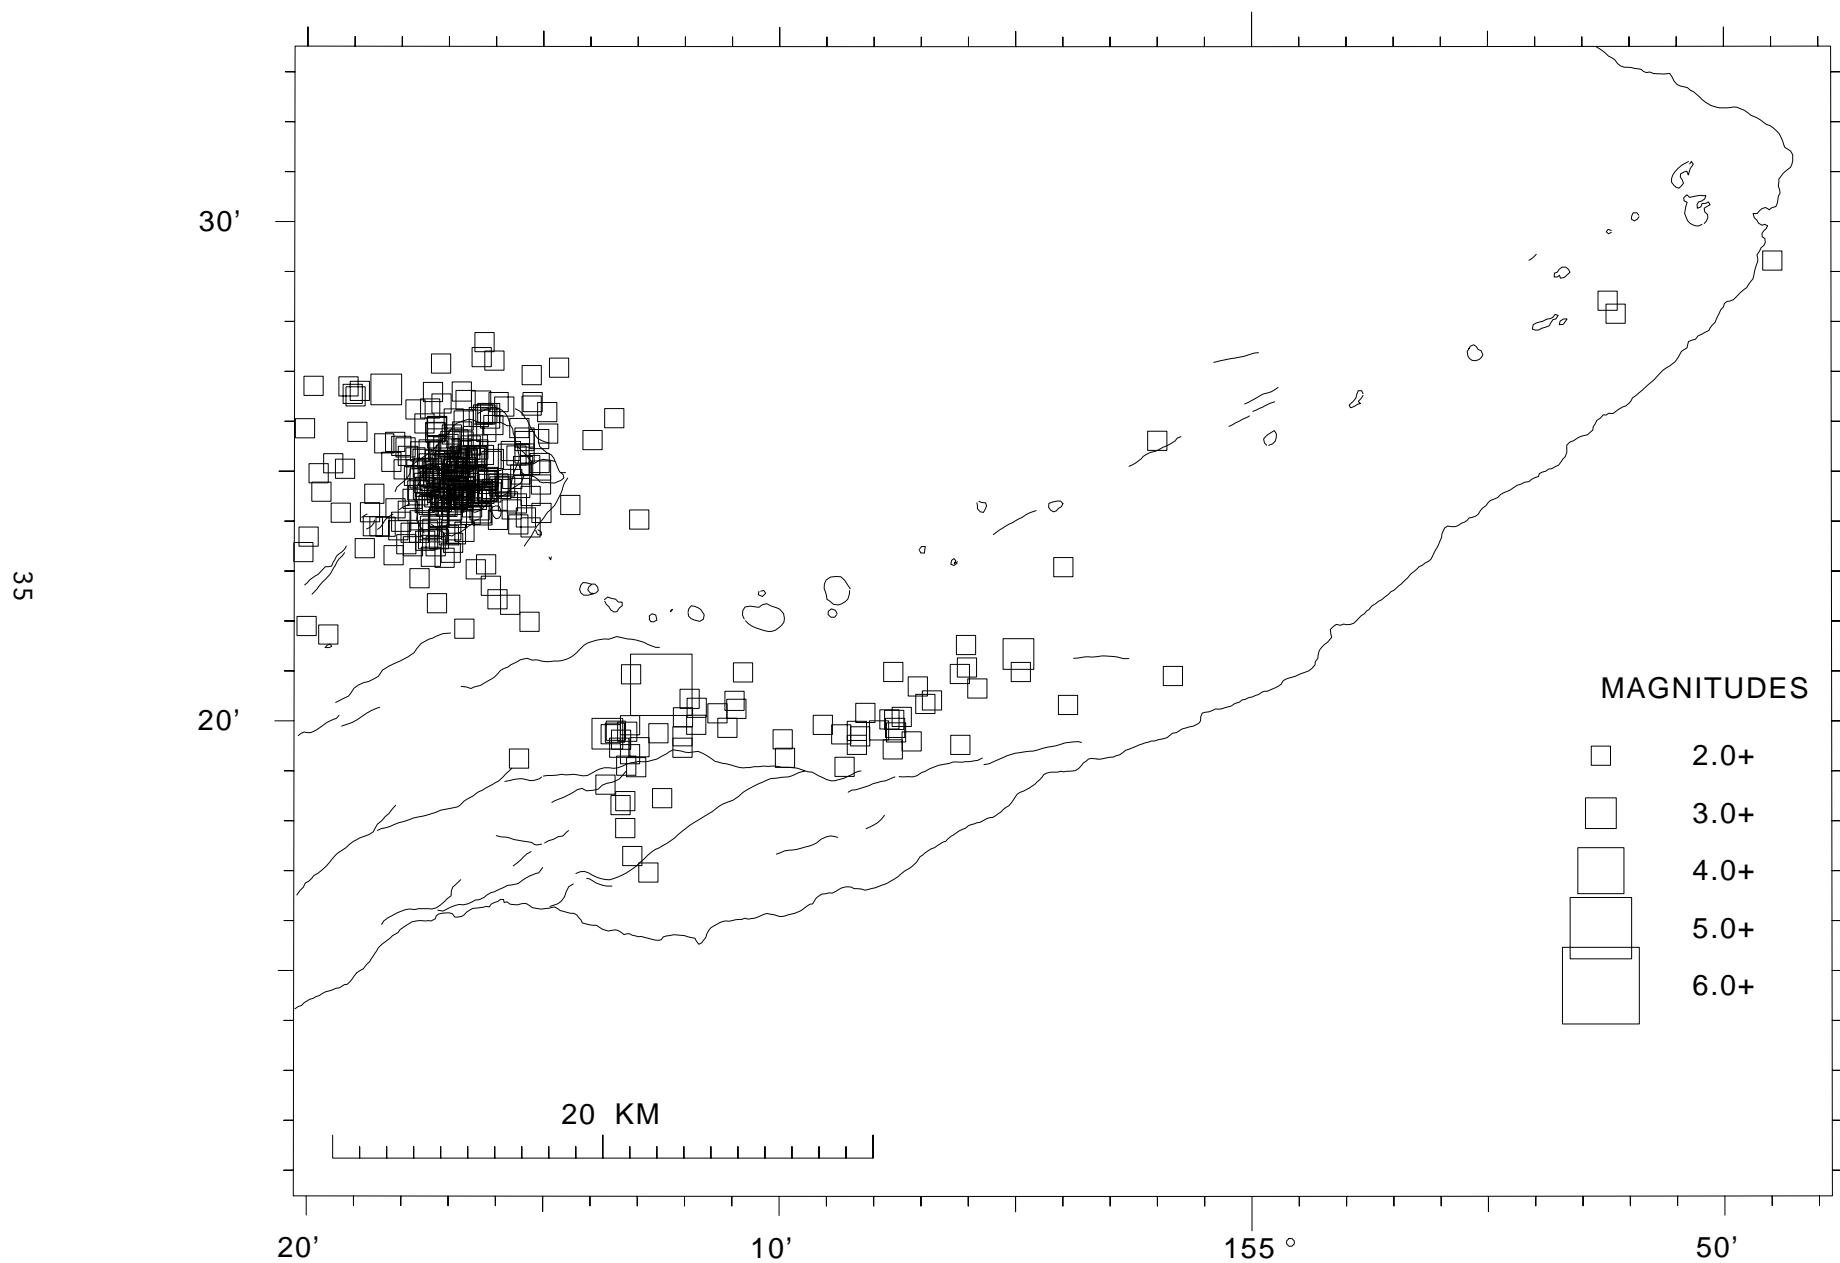

Figure 21. 2000 earthquake locations, Kilauea south flank,
deep (13.1–60.0 km depth), M>=2.0.

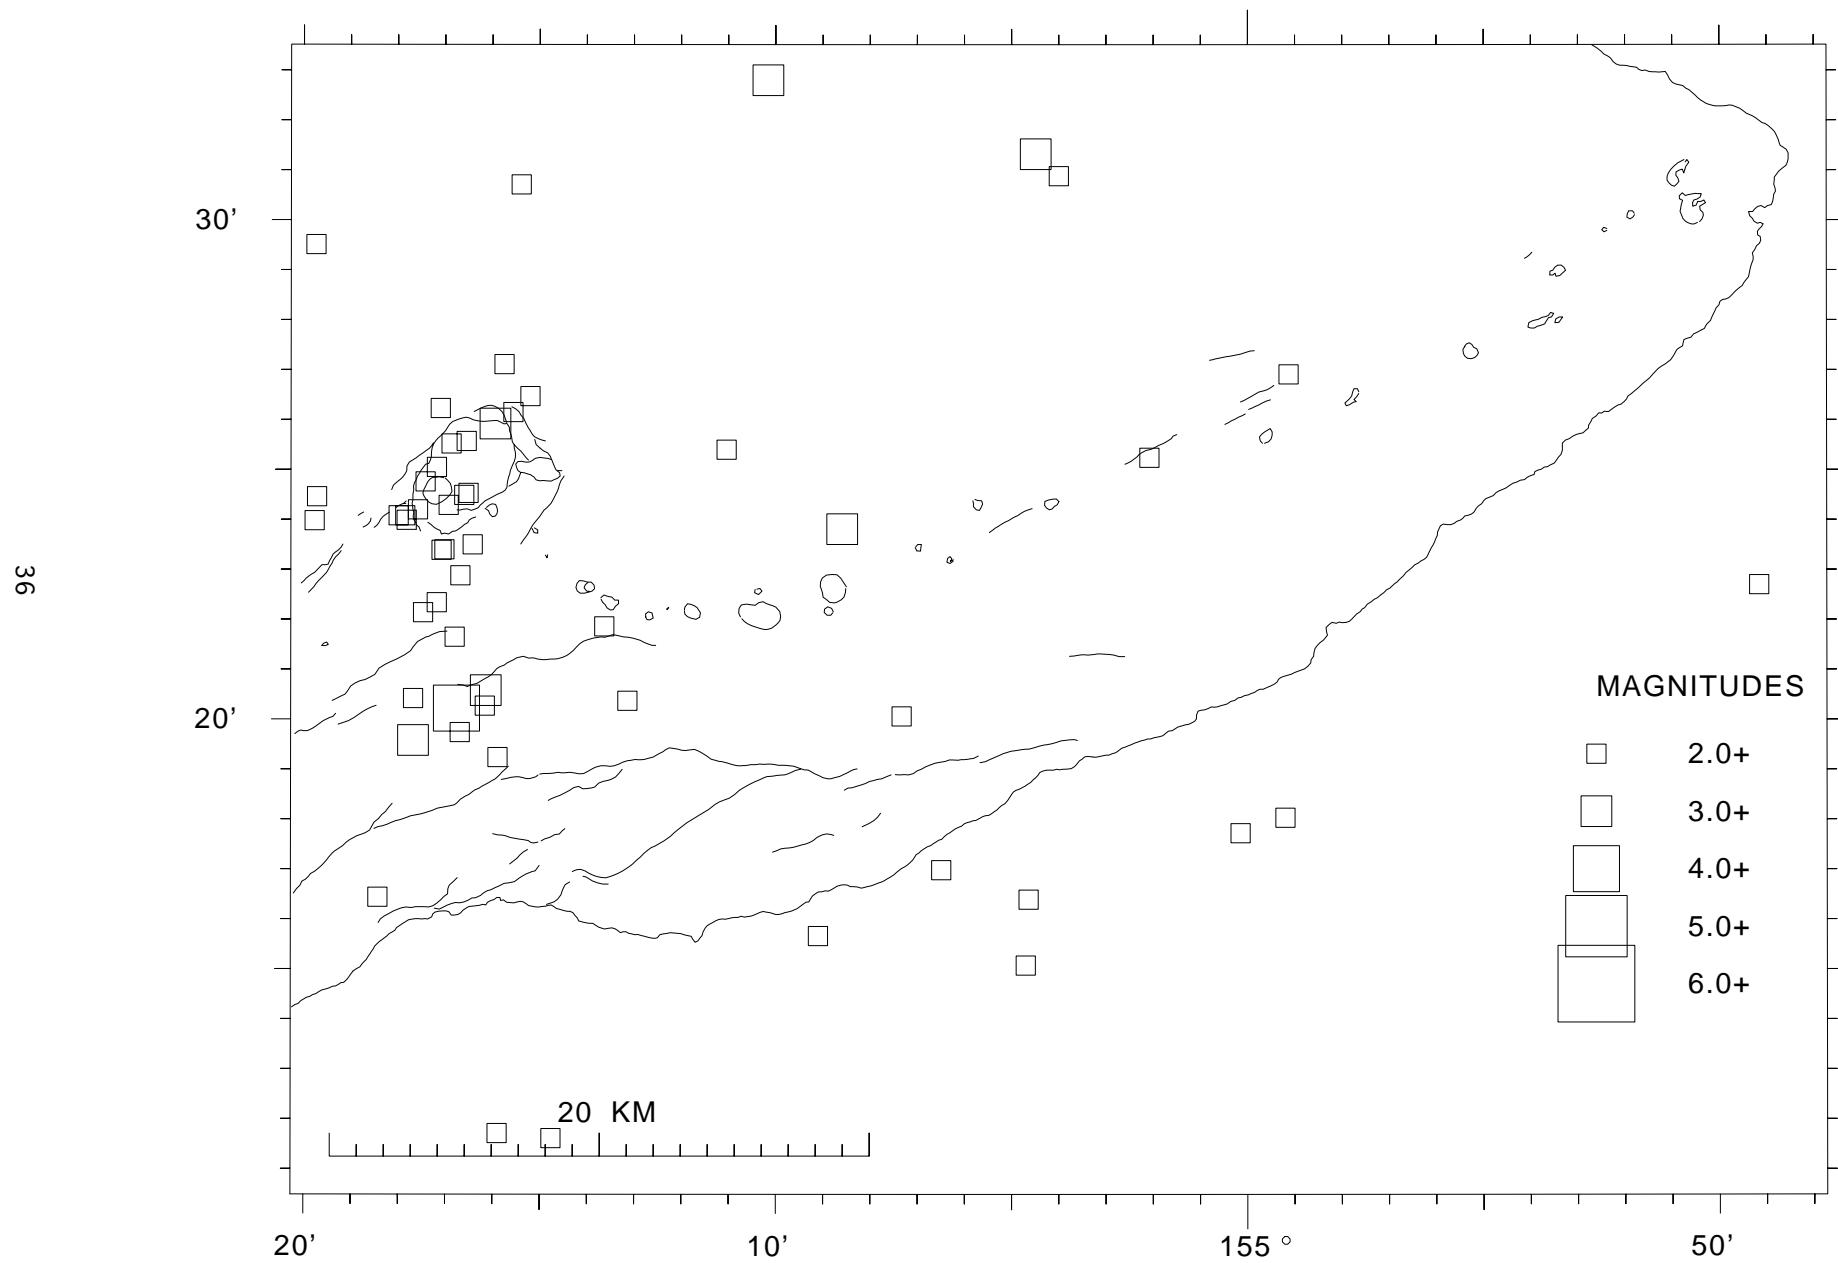

Figure 22. 2000 earthquake locations, Mauna Loa summit,
shallow (0–5.0 km depth), $M \geq 2.0$.

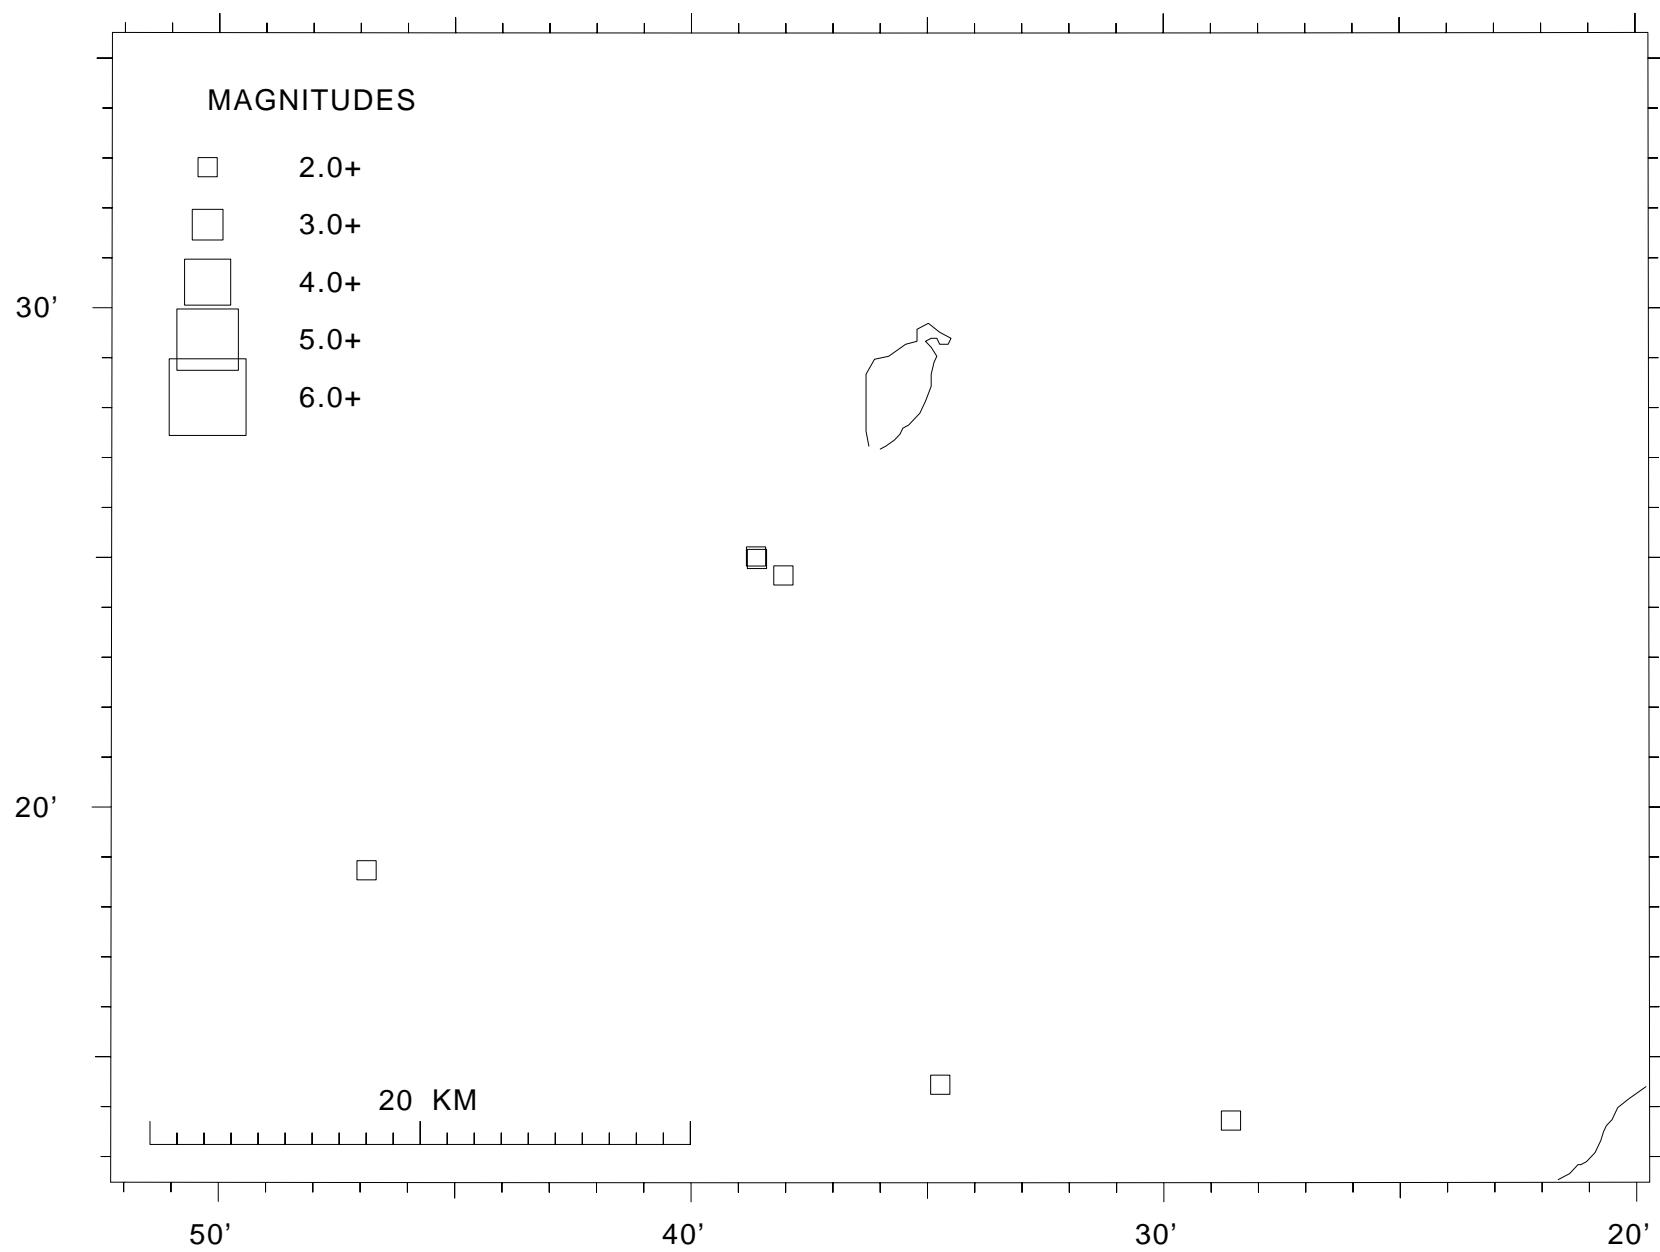

Figure 23. 2000 earthquake locations, Mauna Loa summit,
intermediate (5.1–13.0 km depth), $M \geq 2.0$.

38

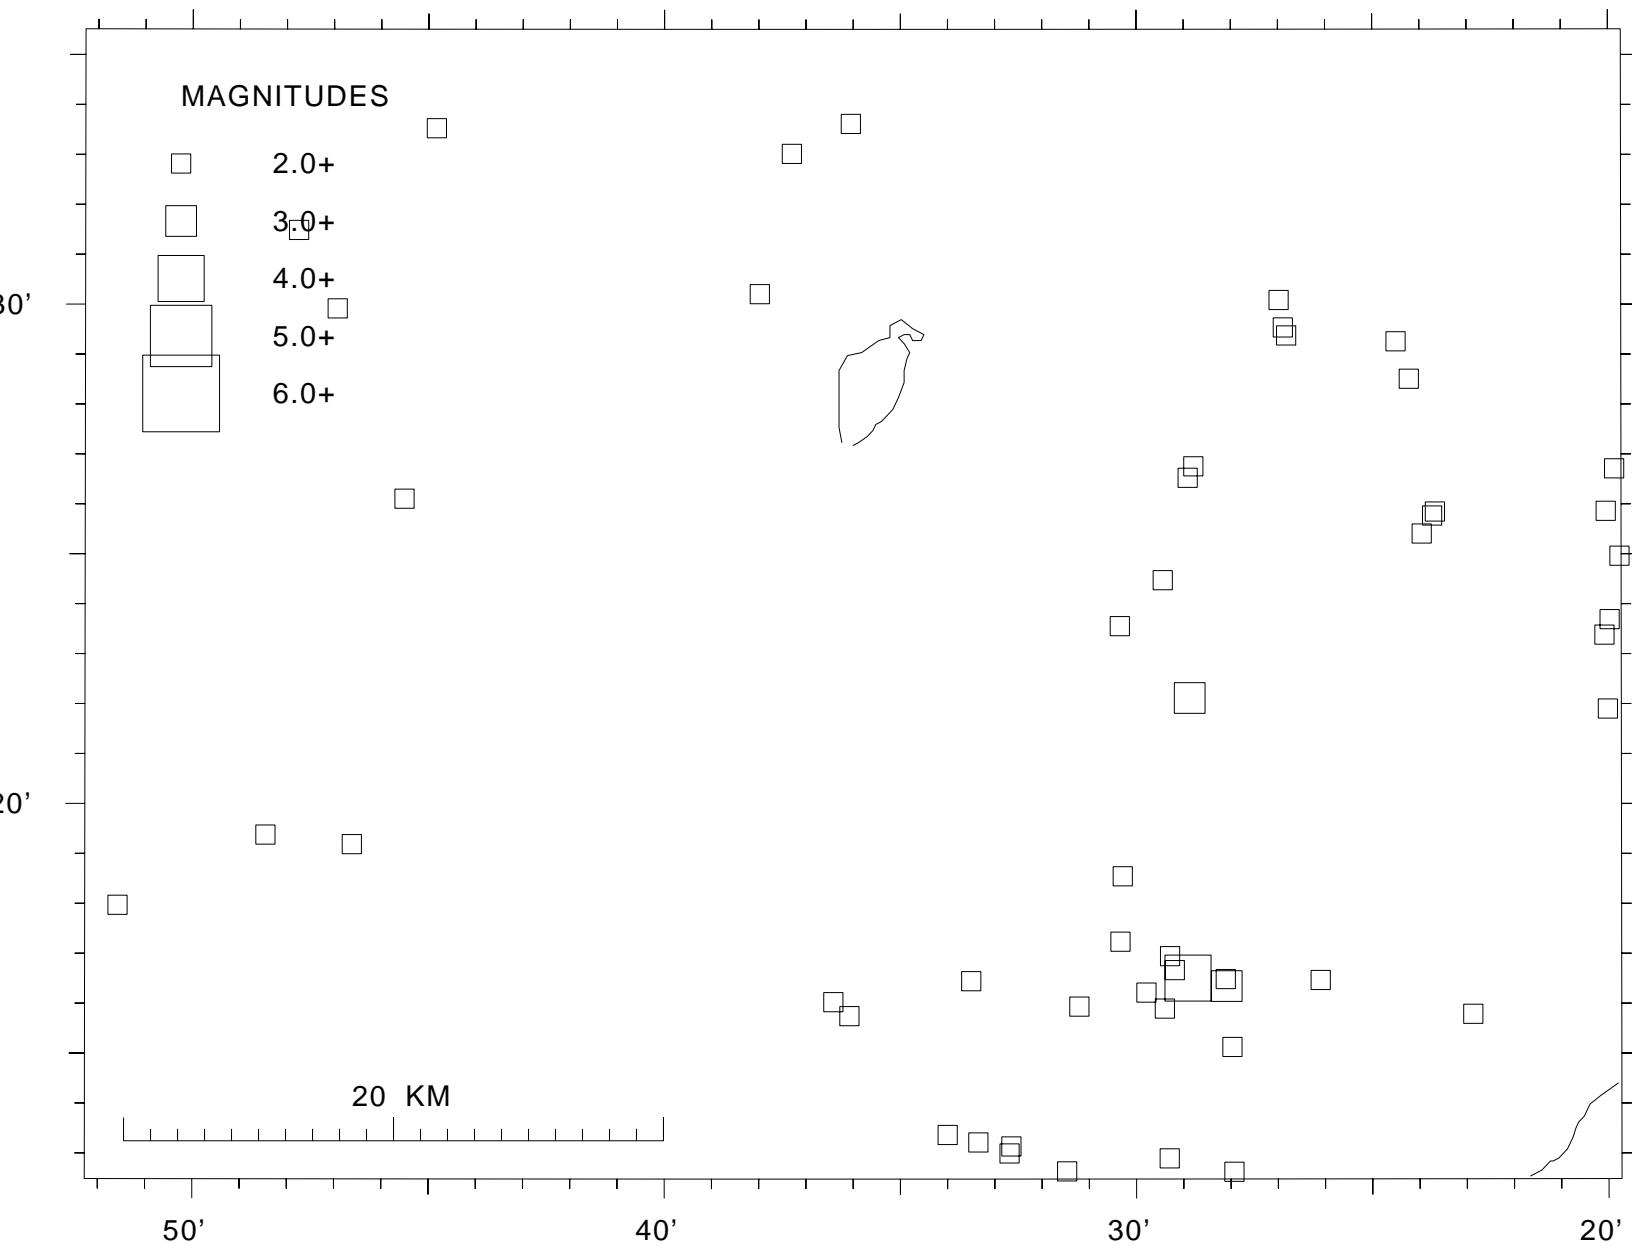

Figure 24. 2000 earthquake locations, Mauna Loa summit,
deep (13.1–60.0 km depth), $M \geq 2.0$.

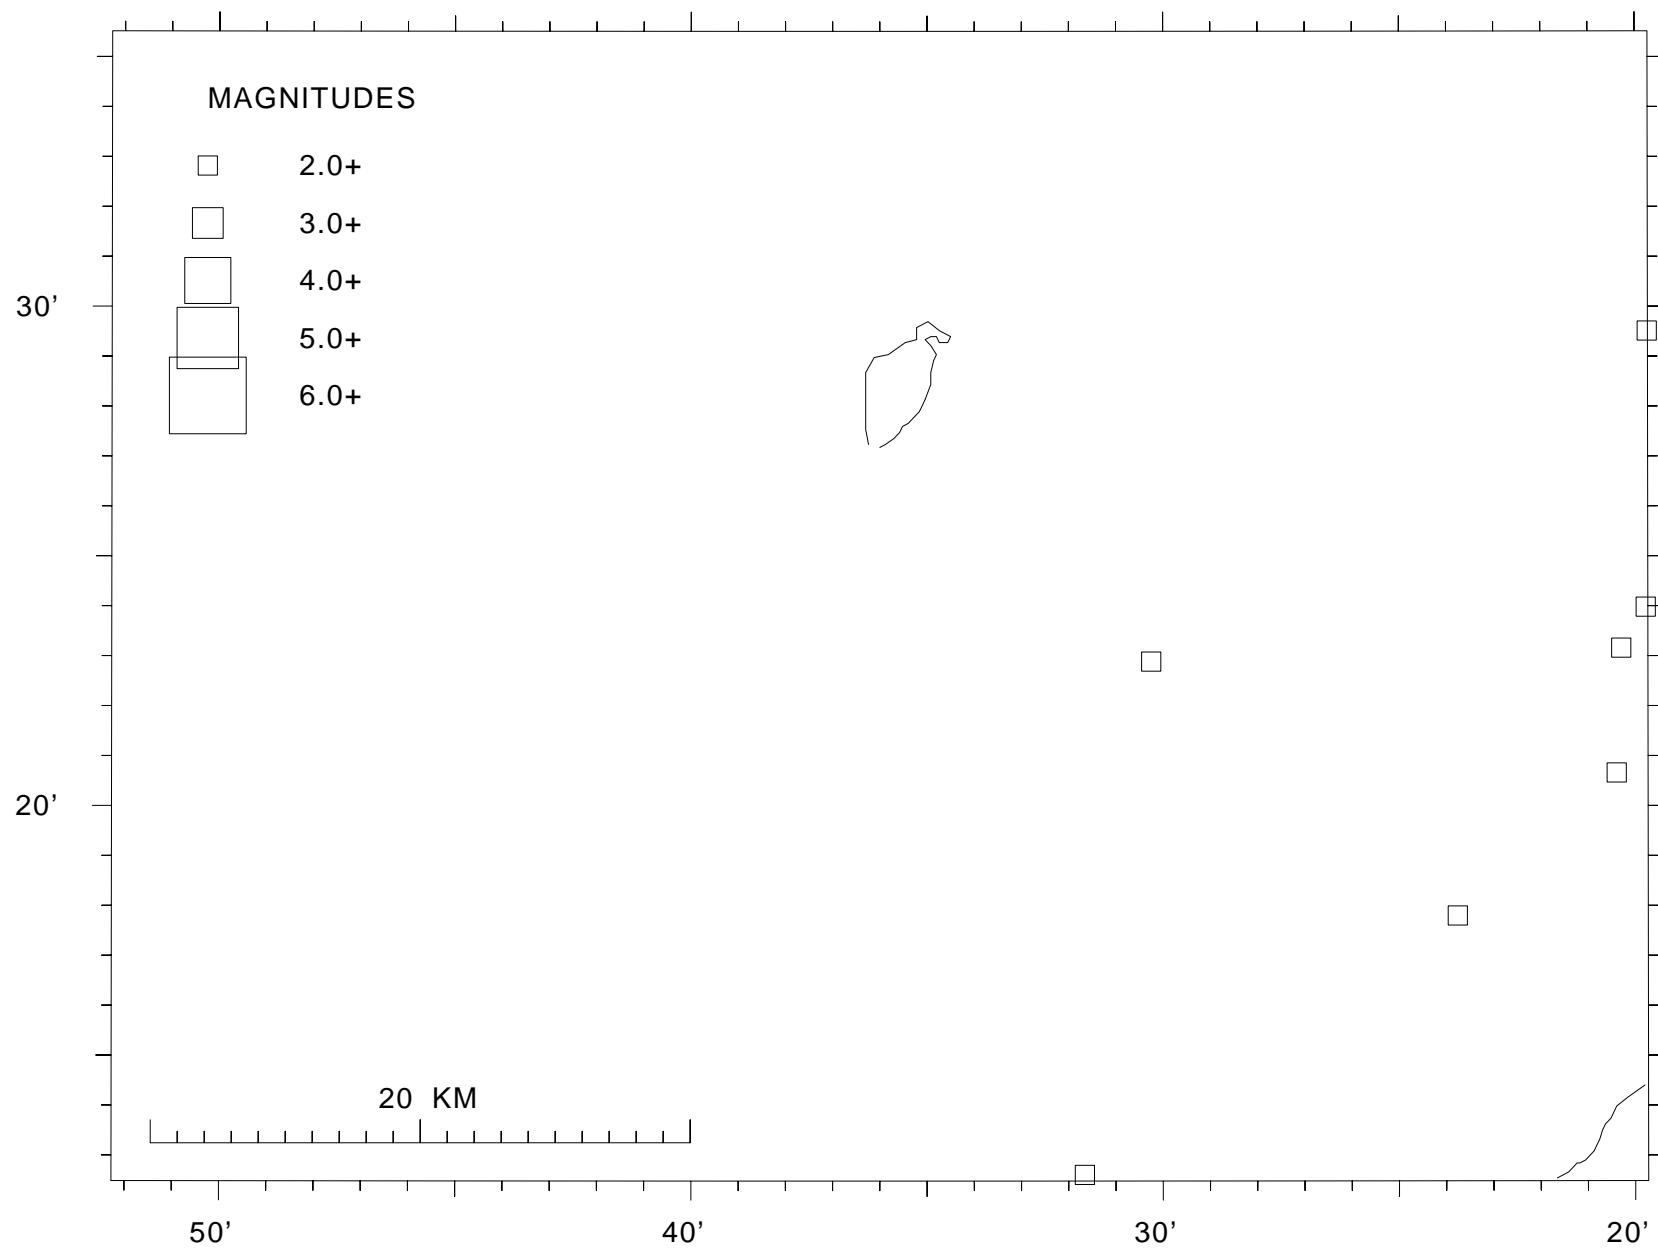

Table 4 is a chronological list of selected events successfully located during 2000. For each event, the following data are presented:

ORIGIN TIME - in Hawaiian Standard Time: date, hour (HR), minute (MN), and second (SEC).

EPICENTER - in degrees and minutes of north latitude (LAT N) and west longitude (LON W) in Old Hawaiian Datum.

DEPTH - Depth of focus in kilometers.

NRD - Number of P & S readings with final weights > 0.1.

NS - Number of S readings with final weights > 0.1

RMS SEC - Root mean square travel time residuals, in seconds.

ERH km - Standard error of the epicenter, in kilometers.

ERZ km - Standard error of depth of focus, in kilometers.

LOC REMKS - Remarks, three-letter code for geographic location of events. See Figures 7-10 for location of mnemonic code. Additional one-letter codes have the following meanings:

F felt

L long-period character

T associated with harmonic tremor

B quarry or other blast

the location program had a convergence problem, which usually means that the depth may be unreliable.

- the depth was held fixed.

PREF MAG - The preferred magnitude chosen from the available magnitudes.

Preference set as: X-amplitude magnitude, if none

D-Develocorder duration magnitude, if none

U-external magnitude, usually calculated from drum records.

NRD - The total weight of amplitude magnitude readings from contributing stations.

AZ GAP - Largest azimuthal gap in degrees between azimuthally adjacent stations.

MIN DS - Distance to the nearest station, in kilometers.

Table 5 is a list of events of magnitude 3.0 or greater, selected from Table 4.
